

NOAA, SRS, and USFS/NSTA Symposium: Earth Then, Earth Now: Our Changing Climate

1:30-1:55 p.m.

Welcome, Introductions, Goals for the Symposium

Flavio Mendez, Senior Director, NSTA Learning Center

Paul Tingler, Symposia and Web Seminars Director, NSTA

- About NSTA Symposia
- Agenda/Goals/Forms/Logistics/Introductions

Frank Niepold - Climate Education Coordinator, NOAA

Dr. Karen Flammer - Senior Science Advisor, Sally Ride Science

Leesa Hubbard - Teacher, Wilson County, Tennessee - Sally Ride Science

Dr. Steve McNulty - Research Ecologist and Team Leader of the US Forest Service Southern Global Change Program - U. S. Forest Service

Dr. Pieter Tans - Senior Scientist at the Earth System Research Laboratory - NOAA

Dr. Heidi Cullen - Senior Research Scientist - Climate Central

1:55-2:05 p.m.

Overview Presentation: How Do We Create a Climate Literate Society?

Frank Niepold, NOAA

Learning Outcomes:

After participating in the presentation,

- Participants will identify at least one component of a climate literate person.
- Participants will name at least one reason climate literacy is important.
- Participants will describe at least two connections for climate literacy in their classrooms.

2:05-2:40 p.m.

Carbon Dioxide and Climate

Dr. Pieter Tans, NOAA

Learning Outcomes:

After participating in the presentation,

- Participants will explain the greenhouse effect and why it matters.
- Participants will explain how we know that carbon dioxide levels are higher now than in the past.
- Participants will identify the cause for the increased carbon dioxide levels.
- Participants will name two effects of increased carbon dioxide levels.
- Participants will list two ways their actions can help to mitigate increasing levels of carbon dioxide.

2:40-3:30 p.m.

Activity 1: Carbon Sources and Sinks

Dr. Karen Flammer, Sally Ride Science
Leesa Hubbard, Sally Ride Science
Dr. Heidi Cullen, Climate Central

Learning Outcomes:

After participating in the activity,

- Participants will identify carbon sources and sinks.
- Participants will describe the difference between anthropogenic and natural carbon processes.
- Participants will explain the carbon cycle and how it changes.

3:30-3:45 p.m.

Break

3:45-4:20 p.m.

Teaching Climate Change to Children: Lessons from the Forest

Dr. Steve McNulty, U. S. Forest Service

Learning Outcomes:

After participating in the presentation,

- Participants will explain the results of climate change on ecosystems.
- Participants will identify two impacts of climate change on forests.
- Participants will describe a positive and a negative impact of climate change.

4:20-5:10 p.m.

Activity Two: What do Tress Have to do With Climate Change?

Dr. Karen Flammer, Sally Ride Science
Leesa Hubbard, Sally Ride Science
Vicki Arthur, U.S. Forest Service

Learning Outcomes:

After participating in the activity,

- Participants will be able to list 3 facts about the importance of forests in the climate change issue.
- Participants will understand how a tree captures and stores carbon.
- Participants will be able to give at least one thing they can do individually to help control climate change.

5:10-5:25 p.m.

What Can We Do?

Dr. Heidi Cullen, Climate Central

Learning Outcomes:

After participating in the activity,

- Participants will list two ways their actions can help to mitigate increasing levels of carbon dioxide.
- Participants will identify two ways policy makers are helping to mitigate the effects of climate change.

5:25-6:00 p.m.

Final Words

- Post-assessment form
- Evaluation form/Survey/Credit Info
- NSTA Web Seminars
- Drawing of door prizes

National Science Education Standards Addressed: Content Standards, 5-8

Content Standard A: Abilities Necessary to do Scientific Inquiry

- Develop descriptions, explanations, predictions and models using evidence.

Understanding about Scientific Inquiry

- Different kinds of questions suggest different kinds of scientific investigations. Some investigations involve observing and describing objects, organisms, or events; some involve collecting specimens; some involve experiments; some involve seeking more information; some involve discovery of new objects and phenomena; and some involve making models.
- Scientific explanations emphasize evidence, have logically consistent arguments, and use scientific principles, models, and theories. The scientific community accepts and uses such explanations until displaced by better scientific ones. When such displacement occurs, science advances.

Content Standard C: Life Science

As a result of their activities in grades 5-8, all students should develop an understanding of

- Populations and Ecosystems
 - The number of organisms an ecosystem can support depends on the resources available and abiotic factors, such as quantity of light and water, range of temperatures, and soil composition. Given adequate biotic and abiotic resources and no disease or predators, populations (including humans) increase at rapid rates. Lack of resources and other factors, such as predation and climate, limit the growth of populations in specific niches in the ecosystem.

Content Standard D: Earth and Space Science

As a result of their activities in grades 5-8, all students should develop understanding of

- Structure of the Earth System
 - Living organisms have played many roles in the earth system, including affecting the composition of the atmosphere, producing some types of rocks, and contributing to the weathering of rocks.
 - Global patterns of atmospheric movement influence local weather. Oceans have a major effect on climate, because water in the oceans holds a large amount of heat.
- Earth's History
 - The earth processes we see today, including erosion, movement of lithospheric plates, and changes in atmospheric composition, are similar to those that occurred in the past. Earth history is also influenced by occasional catastrophes, such as the impact of an asteroid or comet.

Content Standard F:

Science in Personal and Social Perspectives

As a result of their activities in grades 5-8, all students should develop understanding of

- Natural Hazards
 - Human activities also can induce hazards through resource acquisition, urban growth, land-use decisions, and waste disposal. Such activities can accelerate many natural changes.
- Risks and Benefits
 - Individuals can use a systematic approach to thinking critically about risks and benefits. Examples include applying probability estimates to risks and comparing them to estimated personal and social benefits.
 - Important personal and social decisions are made based on perceptions of benefits and risks.

Content Standard G:

History and Nature of Science

As a result of their activities in grades 5-8, all students should develop understanding of

- Science as a Human Endeavor
 - Women and men of various social and ethnic backgrounds--and with diverse interests, talents, qualities, and motivations--engage in the activities of science, engineering, and related fields such as the health professions. Some scientists work in teams, and some work alone, but all communicate extensively with others.

National Science Education Standards Addressed: Content Standards, 9-12

Content Standard A:

Abilities Necessary to do Scientific Inquiry

As a result of their activities in grades 9-12, all students should develop understanding of

- Understanding About Scientific Inquiry
 - Human Scientists usually inquire about how physical, living, or designed systems function. Conceptual principles and knowledge guide scientific inquiries. Historical and current scientific knowledge influence the design and interpretation of investigations and the evaluation of proposed explanations made by other scientists.

Content Standard C:

Life Science

As a result of their activities in grades 9-12, all students should develop understanding of

- The Interdependence of Organisms
 - Human beings live within the world's ecosystems. Increasingly, humans modify ecosystems as a result of population growth, technology, and consumption. Human destruction of habitats through direct harvesting, pollution, atmospheric changes, and other factors is threatening current global stability, and if not addressed, ecosystems will be irreversibly affected.
- Matter, Energy, and Organization in Living Systems
 - The distribution and abundance of organisms and populations in ecosystems are limited by the availability of matter and energy and the ability of the ecosystem to recycle materials.

Content Standard D:

Earth and Space

As a result of their activities in grades 9-12, all students should develop understanding of

- Geochemical Cycles
 - The earth is a system containing essentially a fixed amount of each stable chemical atom or element. Each element can exist in several different chemical reservoirs. Each element on earth moves among reservoirs in the solid earth, oceans, atmosphere, and organisms as part of geochemical cycles.
 - Movement of matter between reservoirs is driven by the earth's internal and external sources of energy. These movements are often accompanied by a change in the physical and chemical properties of the matter. Carbon, for example, occurs in carbonate rocks such as limestone, in the atmosphere as carbon dioxide gas, in water as dissolved carbon dioxide, and in all organisms as complex molecules that control the chemistry of life

Content Standard F:

Science in Personal and Social Perspectives

As a result of their activities in grades 9-12, all students should develop understanding of

- Natural Resources
 - Humans use many natural systems as resources. Natural systems have the capacity to reuse waste, but that capacity is limited. Natural systems can change to an extent that exceeds the limits of organisms to adapt naturally or humans to adapt technologically.
- Environmental Quality
 - Natural ecosystems provide an array of basic processes that affect humans. Those processes include maintenance of the quality of the atmosphere, generation of soils, control of the hydrologic cycle, disposal of wastes, and recycling of nutrients. Humans are changing many of these basic processes, and the changes may be detrimental to humans.
 - Materials from human societies affect both physical and chemical cycles of the earth.
- Natural and Human-Induced Hazards
 - Natural and human-induced hazards present the need for humans to assess potential danger and risk. Many changes in the environment designed by humans bring benefits to society, as well as cause risks. Students should understand the costs and trade-offs of various hazards—ranging from those with minor risk to a few people to major catastrophes with major risk to many people. The scale of events and the accuracy with which scientists and engineers can (and cannot) predict events are important considerations.
- Science And Technology In Local, National, And Global Challenges
 - Humans have a major effect on other species. For example, the influence of humans on other organisms occurs through land use—which decreases space available to other species—and pollution—which changes the chemical composition of air, soil, and water.
